                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a new telomerase reverse transcriptase (TERT) TF and/or TF-13 repressor binding site. The nucleic acid comprising the binding site sequence is useful in preparing constructs, such as vectors and expression systems, and probes for the TERT TF-8 and/or TF-13 repressor binding site in non-human animals. Modulating the transcription repressor binding site in non-human animals. Modulating the transcription regulate telomerase expression, can be used in immortalization of reagents useful in life science research, and therapeutic research. Inhibitors of TERT transcription repression by a TF-8 and/or TF-13 repressor may be used for increasing the proliferative capacity of a cell, and for treating progeria, Hutchinson-Gillford syndrome, cardiovascular disease, osteoporosis, or AIDS. The present sequence

The invention relates to a new telomerase reverse transcriptase (TERT) TP and/or TF-13 repressor binding site. The nucleic acid comprising the binding site sequence is useful in preparing constructs, such as vectors and expression systems, and probes for the TERT TF-8 and/or TF-13 repressor binding site in non-human animals. Modulating the transcription repressor binding site in non-human animals. Modulating the transcription repressing activity of TERT TF-8 and/or TF-13 repressor factors to regulate telomerase expression, can be used in immortalization of cells, production of reagents useful in life science research, and therapeutic research. Inhibitors of TERT transcription repression by a TF-8 and/or TF-13 repressor may be used for increasing the proliferative capacity of a cell, and for treating Progeria, Hutchinson-Ciliford syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a nucleic acid present in other than its natural environment, having a nucleotide sequence that is the same or is substantially identical to a telomerase reverse transcriptuse (TERT) activator binding site in the minimal TERT promoter. The nucleic acids, agents and methods are useful for treating callular proliferative diseases, e.g. cancer, acquired immunodeficiency syndrome (AIDS), cardiovascular diseases, or osteoporosis. They are also useful in immune sensescence and skin rejuvenation. The nucleic acids are also useful in preparing constructs, e.g. vectors, expression systems, or probes. The present sequence represents the TERT minimal promoter

This invention relates to a novel polynucleotide comprising a human telomerase promoter and at least one viral El gene. Specifically, the genes are BlA, IRES and ElB and the human telomerase promoter is preferably high. The present invention describes a virus containing this polynucleotide and an anticancer agent that replicates efficiently in tumour cells and causing cell death. As such, it can be used for the treatment of cancer, in particular cancer of the stomach, large intestine, lung, liver, prostate, pancreas, digestive tract, bladder, mammary gland, uterus, thyroid gland and ovary. Accordingly, this composition exhibits cycostatic activity. This polynucleotide sequence is the human telomerase promoter (HTERT) DNA of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel 5' flanking regulatory sequence from the human catalytic telomerase subunit gene. Recombinant constructs containing the product of the invention can be linked with DNA encoding an anti-tumour protein or reporter protein. The constructs are useful for identifying candidate substances that modulate the activity of the telomerase regulatory region. The constructs can be used in cancer
                                                                                                                                                                                                                                                                                                                                                                               441
                                                                                                                                                                                                                                                                                                                                                                                                                                    120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         381
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   321

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        anti-tumour; reporter;
neoplastic condition such as lung, breast, prostate or colon cancer. The viral vectors are useful in studying methods of killing neoplastic cells in vitro or in animal models. The present nucleic acid sequence represents a viral DNA sequence that was used in the methods of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New 5' flanking regulatory sequence from the human catalytic telomerase subunit gene useful for cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CGAGTTTCAGGCAGCGCTGCGTCCTGCTGCGCACGTGGGAAGCCCTGGCCCCGGCCACCC

The present invention relates to a new method of modulating expression of telomerase reverse transcriptase (TERT) from a TERT expression system that includes a TERT promoter and a Site C repression system can that includes a TERT promoter and a Site C repression repression by the Site C repression invention involves modulating TERT transcription repression by the Site C repression of TERT for producing a mammalian can the Site C repression of TERT for producing a mammalian of useful for modulating expression of TERT for producing a mammalian can therefore, including immortalisation of cells, production of reagents of presents applications, including immortalisation of cells, production of reagents cremening amortalisation of cells, production of reagents contenting and or increases telomeral length and cells applications in such that severe solution and cells and such as Progeria or Hutchinson-cells syntame senses relomeration and to inhibit immune sensescence. The method can be employed to lengthen telomeres of osteoblast and osteoclast stem cells, encouraging bone replacement and osteoclast stem cells, encouraging bone replacement and can as such the method improves the survival and effectiveness of bone marrow and skin cell transplants. Generally and relations contains such the method improves the survival and effectiveness of bone marrow and skin cell transplants. Decreasing TERT expression is useful for treating cellular proliferative disease conditions, including cequence represents plasmid SSI20 minimal telomerace promoter sequence. This sequence contains part of the human. TERT minimal promoter sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 CGGCTCTCCGCGCGGACCCGCCCGTCCCGACCCCTCCCGGGTCCCCGGCCCAGCCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                      The invention describes a compound, 8-50 nucleobases in length targeted to a nucleic acid molecule encoding human TERT (telomerase reverse transcriptase), where the compound specifically hybridises with and inhibits the expression of TERT. A series of oligonucleotides were conclections in length and composed of a central gap region consisting of the 2'-deoxynucleotides, flanked on both sides (5' and 3' directions) by five-nucleotide wings. The wings were composed of 2'-methoxyethyl (2'-KMS) nucleotide wings. The wings were composed for their effect on human TERT mRNA levels by reverse transcriptase (RT)-polymerase chain reaction (PGR). The compound is useful for inhibiting the expression of TERT in calls or tissues, for reacting a human having disease or condition associated with TERT, for modulating apoptosis, for inhibiting cell growth (preferably, cancer cell growth), in antisense therapy and for creares transcriptase (TERT) #1, sequence encodes human telomerase reverse transcriptase (TERT) #1, and is used to create antisense

                                                                                                                                                                                                                                                                  The invention relates to expressing gene product in a cell type-
preferential manner. The method involves providing a first expression
cassette having a cell type-preferential promoter, providing a second
expression cassette having an inducible promoter, and transferring the
first and second expression cassettes into a cell in which the cell type
specific preferential promoter is active. The methods and compositions
of the present invention are useful for treating cancers of the brain,
head and neck, esophagus, thyroid, stomach, colon, liver, kidney,
prostate, breast, cervix, ovaries, testicles, rectum, skin and blood. The
Expressing gene products in a cell type-preferential manner with a binary or bicistronic expression system, useful for treating cancers of the brain, head and neck, esophagus, thyroid, stomach, colon, liver, prostate, skin and rectum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    255 CCTCCGGGCCCTCCCACCCCTTCCTTTCCGCGGCCCCGCCCTCTCCTCGCGGCC 314

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                    The present invention relates to a new recombinant viral vector comprising an adenoviral nucleic acid backbone, where the backbone comprises in sequential order, a left inverted terminal repeat (ITR), a termination signal sequence, an B2F responsive promoter which is operably linked to a gene essential for replication of the recombinant viral vector, an adenoviral packaging signal and a right ITR. The methods and compositions of the present invention are useful for treating a neoplastic condition such as lung, breast, prostate or colon cancer. The viral vectors are useful in studying methods of killing neoplastic cells in vitro or in animal models. The present nucleic acid sequence represents a human TERT promoter of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121

```
The invention relates to a transcriptional regulatory sequence with a human telomere reverse transcriptase (hTERT) promoter linked to a nucleotide sequence comprishing one or more c-Myo binding sites and/or one or more Spl binding sites and/or one composition are useful for treating cancer, e.g. stomach, lung, ovarian, liver, bronchogenic, nasopharyngeal, laryngeal, pancreatic, bladder, colon, cervical, breast, brain, or head and neck cancer. This sequence corresponds to the wild type human telomerase reverse transcriptase (hTERT) promoter sequence used to generate the novel sequence of the
                                                                                                                                                                                                                                                                                                                                                New transcriptional regulatory sequence with a human telomere reverse transcriptase promoter, useful for treating cancer, e.g. stomach, lung, ovarian, liver, pancreatic, bladder, colon, cervical, breast, brain, or head and neck cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               285 CTCCGGGCCCTCCCACCCCTTCCTTTCCGCGGCCCCGCCCTCTCTCGCGGCGC

or more Spl binding sites. The transcriptional regulatory sequence and composition are useful for treating cancer, e.g. stomach, lung, ovarian, liver, bronchogenic, nasopharyngeal, laryngeal, pancreatic, bladder, colon, cervical, breast, brain, or head and neck cancer. This sequence corresponds to the modified human telomerase reverse transcriptase (hTERT) promoter sequence containing the extra c-Myc and Spl binding site

classification analysis, studying gene development networks and function networks, and designing drugs based on regulatory sequences of the phenotypes for disease treatment. The present sequence represents BNA encoding a telomere reverse transcriptase (TERT), which is used in an example illustrating the use of the method of the invention

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

Sequence 25, Application US/09932581

Patent No. 6686159

GENERAL INFORMATION:

APPLICANT: Andrews, William H.

APPLICANT: Praser, Stepher A.

APPLICANT: Praser, Stepher A.

APPLICANT: Mohammadpour, Hanid

ITILE OF INVENTION: METHODS AND COMPOSITIONS FOR MODULATING

TITLE OF INVENTION: TELOMERASE REVERSE TRANSCRIPTASE (TERT) EXPRESSION

TITLE OF INVENTION: TELOMERASE REVERSE TRANSCRIPTASE (TERT)

CURRENT APPLICATION NUMBER: 60/29/32,581

CURRENT APPLICATION NUMBER: 60/227,865
